

Overview

The Inclusivity project is an accessible fitness tracker app built in Android Studio using Kotlin. The app helps users track daily fitness information while supporting different users through internationalization, accessibility options, and responsive layouts for phone and tablet.

Main Features

The app tracks three fitness categories: steps, calories eaten, and water.

The app starts each fitness value at zero so the user can enter their own daily progress.

Each category has add and subtract buttons so the user can increase or decrease their values.

The app includes a workout plan section where the user can type in their own workout task or plan.

The user can save the workout plan and also delete it if they want to remove the task.

Internationalization

The app includes multiple language options: English, Spanish, and French.

The language controls are placed inside the Settings menu so the main screen stays clean and easy to read.

When the user chooses a language, the app updates the labels and buttons to match that language.

Accessibility

The Settings menu includes a large text option for users who need easier-to-read text.

The Settings menu also includes a high contrast option for users who need stronger color contrast.

The buttons and controls include readable labels so the app is easier to use with accessibility tools.

Responsive Design

The app automatically detects the type of device being used.

On a phone, the app uses a stacked layout that is easy to scroll and use with one hand.

On a tablet, the app uses a wider layout with more space for the tracker and controls.

On a watch or very small screen, the app uses a compact layout designed for smaller displays.

Settings Menu

The app hides language and accessibility controls inside a Settings button.

This keeps the main fitness tracker screen focused on the user's daily fitness data.

When the user taps Settings, the menu opens and shows language, large text, and high contrast options.

Skill Demonstrated: Alter Code Generated By AI To Add A Feature

This project demonstrates altering AI-generated code to add new features. The original app was changed into an accessible fitness tracker that supports phone and tablet layouts, uses Android string resources for English, Spanish, and French localization, includes a hidden Settings menu, provides large text and high contrast accessibility options, lets users add or subtract steps, calories eaten, and water, and allows users to save or delete a custom workout plan.
